Blue-necked keelback at Upper Seletar

Subject: Blue-necked keelback, Macropisthodon rhodomelas (Reptilia: Serpentes: Natricidae).

Subject identified by: Contributor.

Location, date and time: Singapore Island, Central Catchment Nature Reserve, Upper Seletar Reservoir Park; 15 June 2008; around 0010 hrs.

Habitat: Edge of secondary forest.

Observers: Contributor, with Lee King Li and others.

Observation: About 40 cm total length. At edge of the forest. On a leaf of a shrub about 60 cm off the ground. Coiled motionless on the surface of a broad leaf, apparently sleeping (see accompanying picture).

Remarks: In Singapore, this snake appears to inhabit forest, and recorded mainly from the Bukit Timah and Central Catchment Nature Reserves (Baker & Lim, 2012: 113). Although known to be terrestrial and semi-aquatic (see e.g. David & Vogel, 1996: 124), the featured sighting shows that it can be partially arboreal. This species is now known to be venomous. Subaraj (2008) gives an account of the effects suffered from its bite.
