calvinmrducky@gmail.com

Subject: *Turris undosa* (Mollusca: Gastropoda: Turridae).

Subject identified by: Chan Sow-Yan.

Location, date and time: Singapore Strait, Lazarus island; 15 June 2018; 0606 hrs.

Habitat: Rocky shore, with pockets of sand in between large rocks at intertidal zone during a morning low tide.

Observer: Calvin Leow Jiah Jay.

Observation: One live example of about 7 cm shell length, with the apical whorls eroded, was found partially buried with a burrowing trail behind it, in between large boulders at the intertidal zone (see accompanying photograph).

Remarks: Although not listed in the checklist by Tan & Woo (2010), *Turris undosa* has been recorded from Singapore by Sanpanich & Tan (2016: 533) based on material trawled in the Singapore Strait about 3 km to the east of Kusu Island. The present record differs in the location being in an intertidal area. This species appears to be locally rare.
